

# Chapter 7

## Windows Basic Control Item

# 7-1 PictureBox Control Item

- Usage
  - ⇒ draw graph or load image
  - ⇒ show animation

## PictureBox Properties

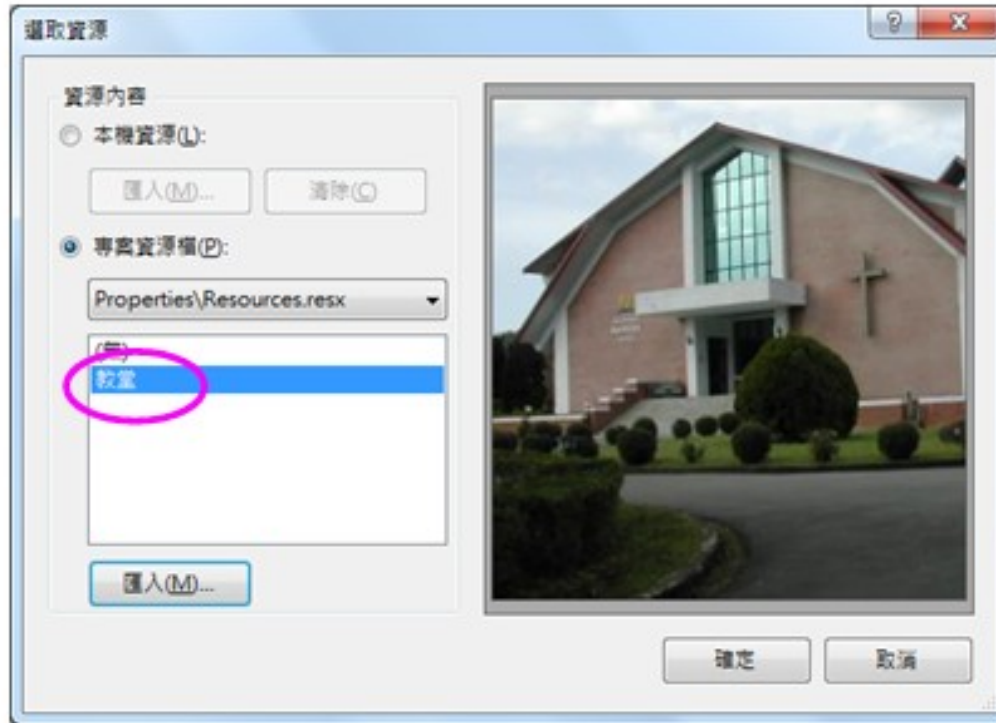

Property	Description
Image	Assign image file name
BorderStyle	None: no border (default) FixedSingle: single line Fixed3D: 3-D line
Location.X	The horizontal coordinates of the upper-left corner of the control relative to the upper-left corner of its container
Location.Y	The vertical coordinates of the upper-left corner of the control relative to the upper-left corner of its container
Size.Width	PictureBox's width (can be abridged as Width)
Size.Height	PictureBox's height (can be abridged as Height)

Property	Description
SizeMode	<p>Normal: The image is placed in the upper-left corner of the PictureBox. (default)</p> <p>StretchImage: The image is stretched or shrunk to fit the size of the PictureBox.</p> <p>AutoSize: The PictureBox is sized equal to the size of the image</p> <p>CenterImage: The image is displayed in the center</p> <p>Zoom: The size of the image is increased or decreased maintaining the size ratio.</p> <p>Ex: <code>pic.SizeMode = PictureBoxSizeMode.Zoom;</code></p>

### 3. Image Format of PictureBox

- **Acceptable image format:  
Bitmap 、 GIF 、 JPEG 、 PNG...etc.**
- **Bitmap(.bmp) is an uncompressed bitmap image**
- **GIF(.gif) only contains 256 colors; animation and transparency is acceptable**
- **JPEG(.jpg) is a compressed bitmap image**
- **PNG(.png) combines the characteristics of GIF and JPEG**

# Set Image File in Design Phase

CAUTION: Click on “本機資源” option, the chosen image file cannot be copied to project directory. Users have to copy image files separately if the project directory is copied. If “專案資源檔” is chosen, no additional duplication is required

# PictureBox Methods

Method	Description
Image.FromFile or new Bitmap	Load image file with full path when program is running Pic.Image = Image.FromFile(@"D:\fig\ex1.jpg"); or Pic.Image = new Bitmap(@"D:\fig\ex1.jpg"); Ps: @"D:\fig\ex1.jpg" can also be written in "D:\\fig\\ex1.jpg"
Point() constructor	Move PictureBox object to the specific X-Y coordinate Ex1: pic.Location = new Point(50, 100); Ex2: pic.Location = new Point(pic.Left - 5, pic.Top + 5); or pic.Left -= 5; pic.Top += 5;

Method	Description
Size() constructor	Set the width and height of the image Ex: <code>pic.Size = new Size(pic.Width / 2, pic.Height / 2);</code> or <code>pic.Width /= 2; pic.Height /= 2;</code>
Dispose()	Clear the content of PictureBox and release the memory space Ex: <code>pic.Dispose();</code> or <code>pic.Image = null;</code>

# Load Image at Runtime

1. Image and executable file are under the same directory:

```
① pic.Image = Image.FromFile ("教堂.jpg") ;  
② pic.Image = new Bitmap ("教堂.jpg") ;
```

2. Image is at the parent directory of the executable file

```
① pic.Image = Image.FromFile (@"..\\教堂.jpg") ;  
② pic.Image = new Bitmap (@"..\\教堂.jpg") ;
```

3. Image and project file is under the same directory:

```
① pic.Image = Image.FromFile (@"..\\..\\教堂.jpg") ;  
② pic.Image = new Bitmap (@"..\\..\\教堂.jpg") ;
```

## ● Image class

- Make the file into the image class

```
Image myPic = Image.FromFile(@"D:\fig\ex1.jpg");
```

- Make the image show in the pictureBox

```
pictureBox1.Image = myPic;
```

## Example(PictureBox):

Design an image viewer, requirements:

1. There are 6 images (pic1.jpg ~ pic6.jpg). The program starts and loads the first image. The property SizeMode is set to Zoom
2. Change the showing image when pressing “上一張” or “下一張”. If the current image is the first image, the button “上一張” is unavailable. If the current image is the last image, the button “下一張” is unavailable
3. Every time press “放大” button, the image is enlarged 10%, the maximum is 100%.

Every time press “縮小” button, the image is shrunk 10%, the minimum is 10%.

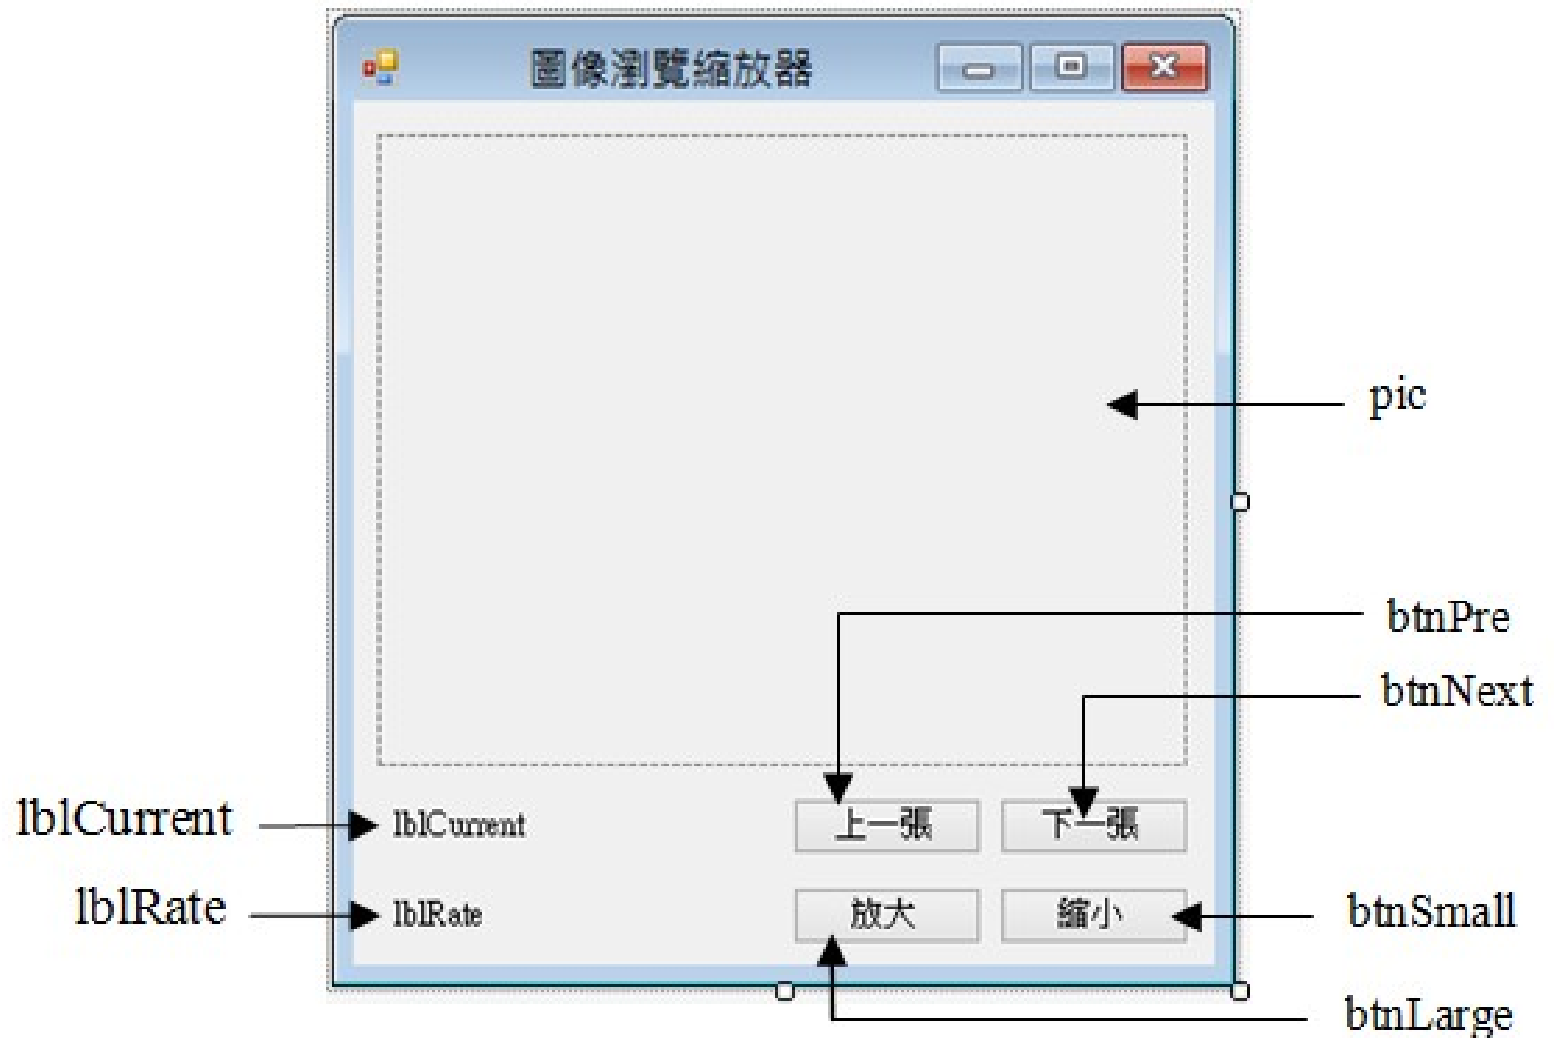

The program shows image in 80% when starting. The image's center position is unchanged during zooming

4. Use lblCurrent label control item to show the order of images. Use lblRate label control item to show the rate of zooming

Result:

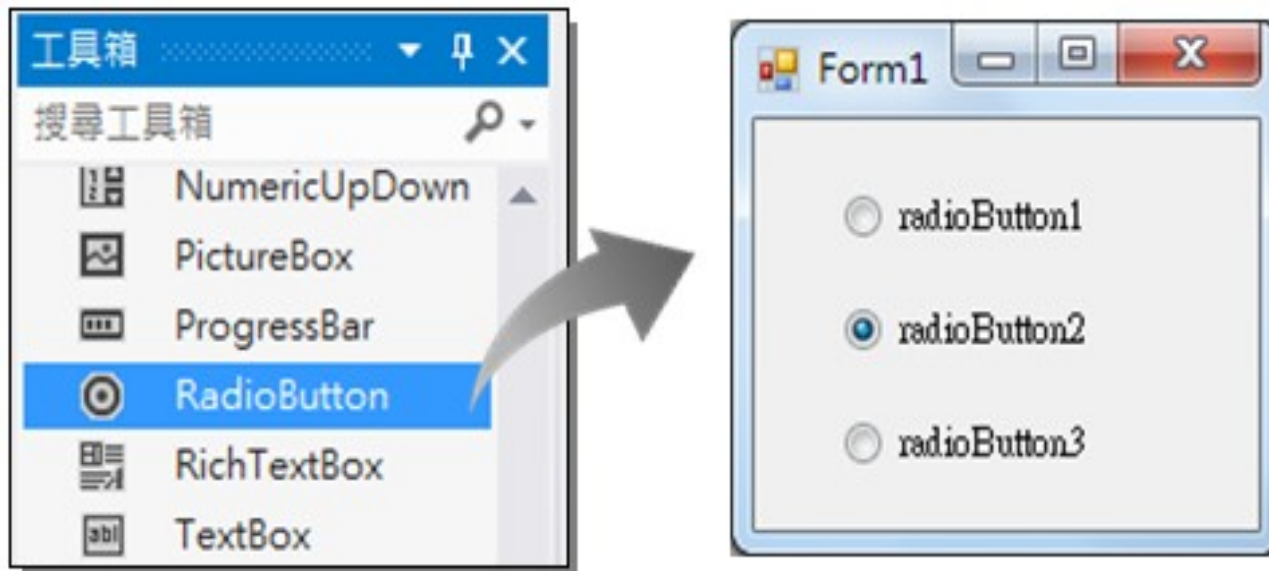

# Design User Interface

## 7-2 RadioButton Control Item

Usage:

**there are many related options and only a single choice is allowed**

Form1

性別

☒ 男

☐ 女

學歷

☐ 小學 ☒ 大學

☐ 國中 ☐ 研究所

☐ 高中

2 choices

5 choices

Form1

☐ 男

☐ 女

☐ 小學 ☐ 大學

☐ 國中 ☐ 研究所

☒ 高中

7 choices

# RadioButton Properties

Property	Description
Checked	<p>False: not selected (default) True: selected</p> <p>Usage: radioButton1.Checked = true;</p>
AutoCheck	<p>True: Checked property can be selected automatically as clicked False: Checked property cannot be selected automatically as clicked</p> <p>Usage: radioButton1.AutoCheck = true;</p>

Text	<p>Set the showing text of the control item</p> <p>Usage: radioButton1.Text = "University"; </p>									
TextAlign	<p>Set the alignment of the control item's showing text. Notice: AutoSize property has to be False</p> <table><tr><td>TopLeft</td><td>TopCenter</td><td>TopRight</td></tr><tr><td>MiddleLeft</td><td>MiddleCenter</td><td>MiddleRight</td></tr><tr><td>BottomLeft</td><td>BottomCenter</td><td>BottomRight</td></tr></table>  <p>Usage: radioButton1.TextAlign = ContentAlignment.MiddleRight;</p>	TopLeft	TopCenter	TopRight	MiddleLeft	MiddleCenter	MiddleRight	BottomLeft	BottomCenter	BottomRight
TopLeft	TopCenter	TopRight								
MiddleLeft	MiddleCenter	MiddleRight								
BottomLeft	BottomCenter	BottomRight								
Appearance	<p>Normal: small circle button and text (default) </p> <p>Button: text surrounded by a frame </p> <p>Usage: radioButton1.Appearance = Appearance.Button;</p>									
CheckAlign	<p>Set the alignment of small circle button when Appearance = Normal, 9 position like TextAlign property</p>									

**Ex:**

set the alignment of radioButton1's circle button TopCenter and the text's alignment BottomCenter

```
radioButton1.AutoSize = false;
```

```
radioButton1.Width = 100;
```

```
radioButton1.Height = 40;
```

```
radioButton1.CheckAlign = ContentAlignment.TopCenter;
```

```
radioButton1.TextAlign = ContentAlignment.BottomCenter;
```

# RadioButton Events

## 1. **CheckedChanged**

- ⇒ **default event**

- ⇒ **triggered when mouse clicked or Checked changed**

- ⇒ **if the radio button is already checked and mouse clicks – no event triggered because the value of Checked keeps True**

## 2. **Click**

- triggered when the radio button is clicked**

## Example(RadioButton):

Design a program for computing 4 fundamental operations of arithmetic, requirements:

1. Choose a manner to calculate. After entering numbers and pressing “=” button, show the result
2. Use Label control item to show the result. Properties:
  - ① Background color: DarkRed
  - ② Foreground color: White
  - ③ Font size: 14pt
3. Label and TextBox control items align text to center
4. If 2 TextBoxs' value are not number as the “=” button is pressed, use try...catch statement to handle the exception and show the error message “請輸入數值!”
5. Digits after the floating point are not limited
6. The divisor cannot be 0 when using division. Show error message “除數不能為零” if the divisor is 0

Result:

四則運算

☒ 加法   ☐ 減法   ☐ 乘法   ☐ 除法

20 + 10

= 30

錯誤訊息

請輸入數值!

確定

錯誤訊息

除數不能為零

確定

# Design User Interface

## 7-3 CheckBox Control Item

- **Single choice, multi choices and no choice are allowed**
- **As a check box is checked**
  - ⇒ **property Checked becomes True**
  - ⇒ **other check boxes are not affected**
- **If click on the checked check box**
  - ⇒ **become unchecked**
  - ⇒ **property Checked becomes False**

# CheckBox Properties

Property	Description
Checked	False: unchecked (default) <input type="checkbox"/> True: checked <input checked="" type="checkbox"/>
ThreeState	True: 3 states: Checked <input checked="" type="checkbox"/> , Unchecked <input type="checkbox"/> , Indeterminate <input type="checkbox"/> False: 2 states: Checked, Unchecked (default)
CheckState	Set the current state of the check box according to ThreeState property 3 property values: Unchecked (default), Checked, Indeterminate

## 2. CheckBox Events

### 1. **CheckedChanged**

⇒ default event of **CheckBox**

⇒ triggered when **Checked** changes value

### 2. **CheckStateChanged**

triggered when **CheckState** changes value

### 3. **Click**

triggered when mouse click on the check box

## Example(exchange):

Design a change exchanger, requirements:

1. The check boxes of 3 types of change is unchecked when the program starts. \$1 is a necessary type. 4 TextBoxes for showing result is set read-only
2. Users can input the number of money and select the type of change they want

The image shows the initial state of a Windows application titled "零錢兌換機" (Change Exchanger). It features a text box labeled "金額:" (Amount) which is empty. Below it, there are four columns for selecting change types: \$50, \$10, \$5, and \$1. Each column has an unchecked checkbox and an empty text box for the count.

金額:	<input type="checkbox"/> \$50	<input type="checkbox"/> \$10	<input type="checkbox"/> \$5	\$1

The image shows the final state of the application after user input. The "金額:" text box now contains the value "567". The checkboxes for \$50 and \$5 are now checked, while \$10 and \$1 remain unchecked. The text boxes for the counts are now populated: 11 for \$50, 3 for \$5, and 2 for \$1. The \$10 column remains empty.

金額:	<input checked="" type="checkbox"/> \$50	<input type="checkbox"/> \$10	<input checked="" type="checkbox"/> \$5	\$1
567	11		3	2

3. The program automatically shows the number of changes in TextBoxes. Use only \$1 to get all of money if no other types of change is selected
4. Automatically show the number of changes when the option of change is checked. Show 0 if there is no input number
5. Input number can only be unsigned integer. Show the error message as the figure if the format of input number is not fit

零錢兌換機

金額: 567

☐ \$50   ☐ \$10   ☐ \$5   ☐ \$1

零錢兌換機

金額:

☒ \$50   ☐ \$10   ☒ \$5   ☐ \$1

       

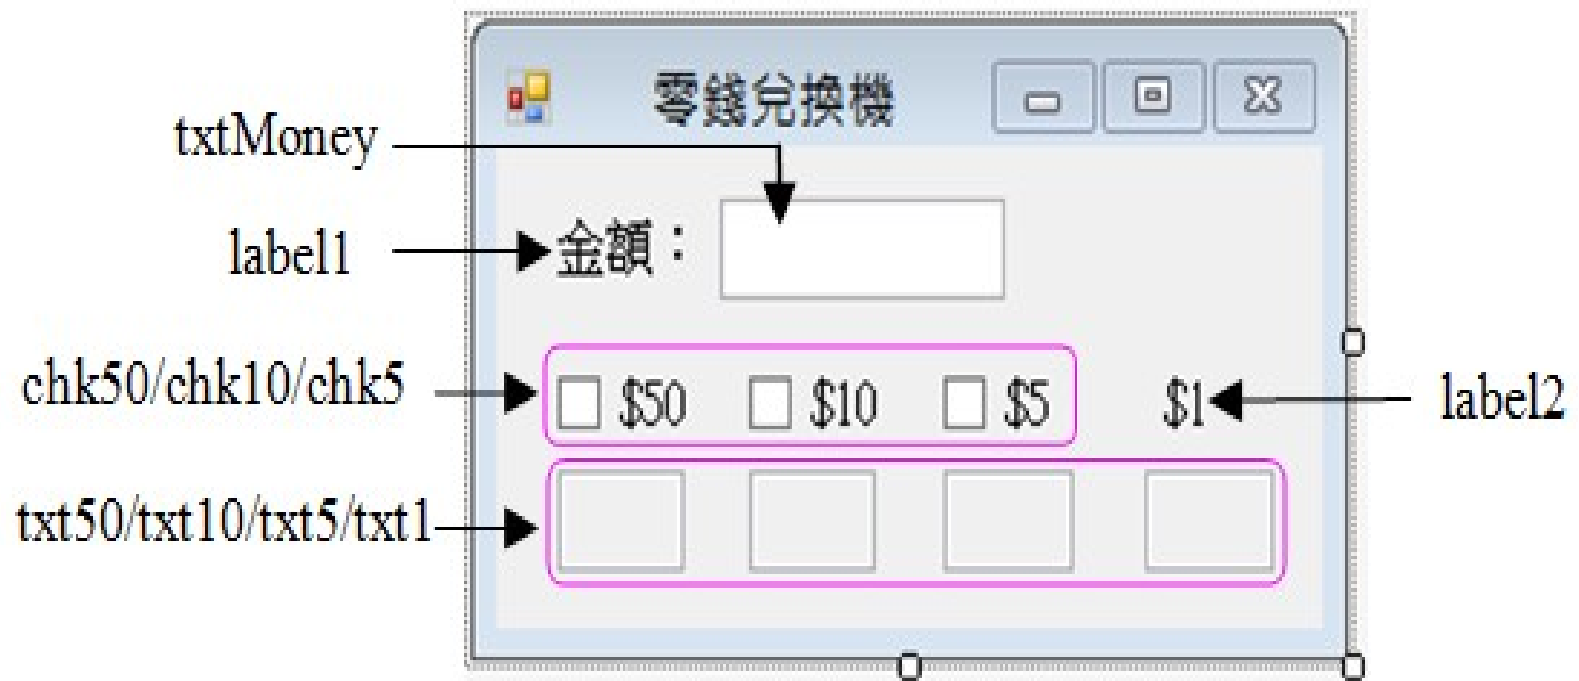

錯誤訊息

請輸入正整數值!

確定

# User Interface

## Example(order):

Design a 3C shopping program, requirements:

1. Check products, enter the quantities, then press “結帳” button to get the total amount of money
2. When the form loads, set properties of the control item used to show total amount of money:
  - ① Foreground color: Color.Red
  - ② Background color: Highlight
  - ③ Font: 標楷體
  - ④ Font size: 14pt
  - ⑤ Font style: italic
  - ⑥ The total amount of money has a prefix “NT\$”, use ToString("#, #") to show formatted number
  - ⑦ Default: iPad2 check box is checked
3. Use text box for quantity input, default value is 1. Show error message “請輸入正整數值!” when the user inputs non-number character. Show error message “不能為負整數值!” when the user inputs minus number

- 
4. Use check boxes to show products, only one option is selected in the same time. If one product is checked, other products cannot be checked. Keep checked when click on checked check box, uncheck the checked check box when the use chooses other check box.
  5. When press “結帳” button, the label control item shows a message like “你購買 iPad Mini 共 2 台，共計 NT\$ 21,000 元” if the number of quantity is right.

Result:

3C 購物中心

Apple 系列產品	數量
<input type="checkbox"/> iPad2 (\$12,500元)	2
<input checked="" type="checkbox"/> iPad Mini (\$10,500元)	
<input type="checkbox"/> iPhone 5 (\$21,900元)	

結帳

你購買 iPad Mini 2台 共計:NT\$21,000元

錯誤訊息

請輸入正整數值！

確定

錯誤訊息

不能為負整數值！

# User Interface

## 7-4 ImageList Control Item

- Can store images
- Available to control items which have ImageList property
- Non-visible control item – run in background
- Acceptable image formats:  
BMP, GIF, ICO, JPG, PNG, etc.
- Control items with ImageList property:  
Button, CheckBox, Label, ListView, RadioButton, etc.

# Use Images of ImageList

1. The control items which have ImageList property can use images of ImageList, e.g.: Button, Label

## Usage:

- ① assign ImageList control item to ImageList property
- ② then assign the index of image to ImageIndex

Ex: show the 1<sup>st</sup> image of imgCars on btnCar Button

```
btnCar.ImageList=imgCars ;
```

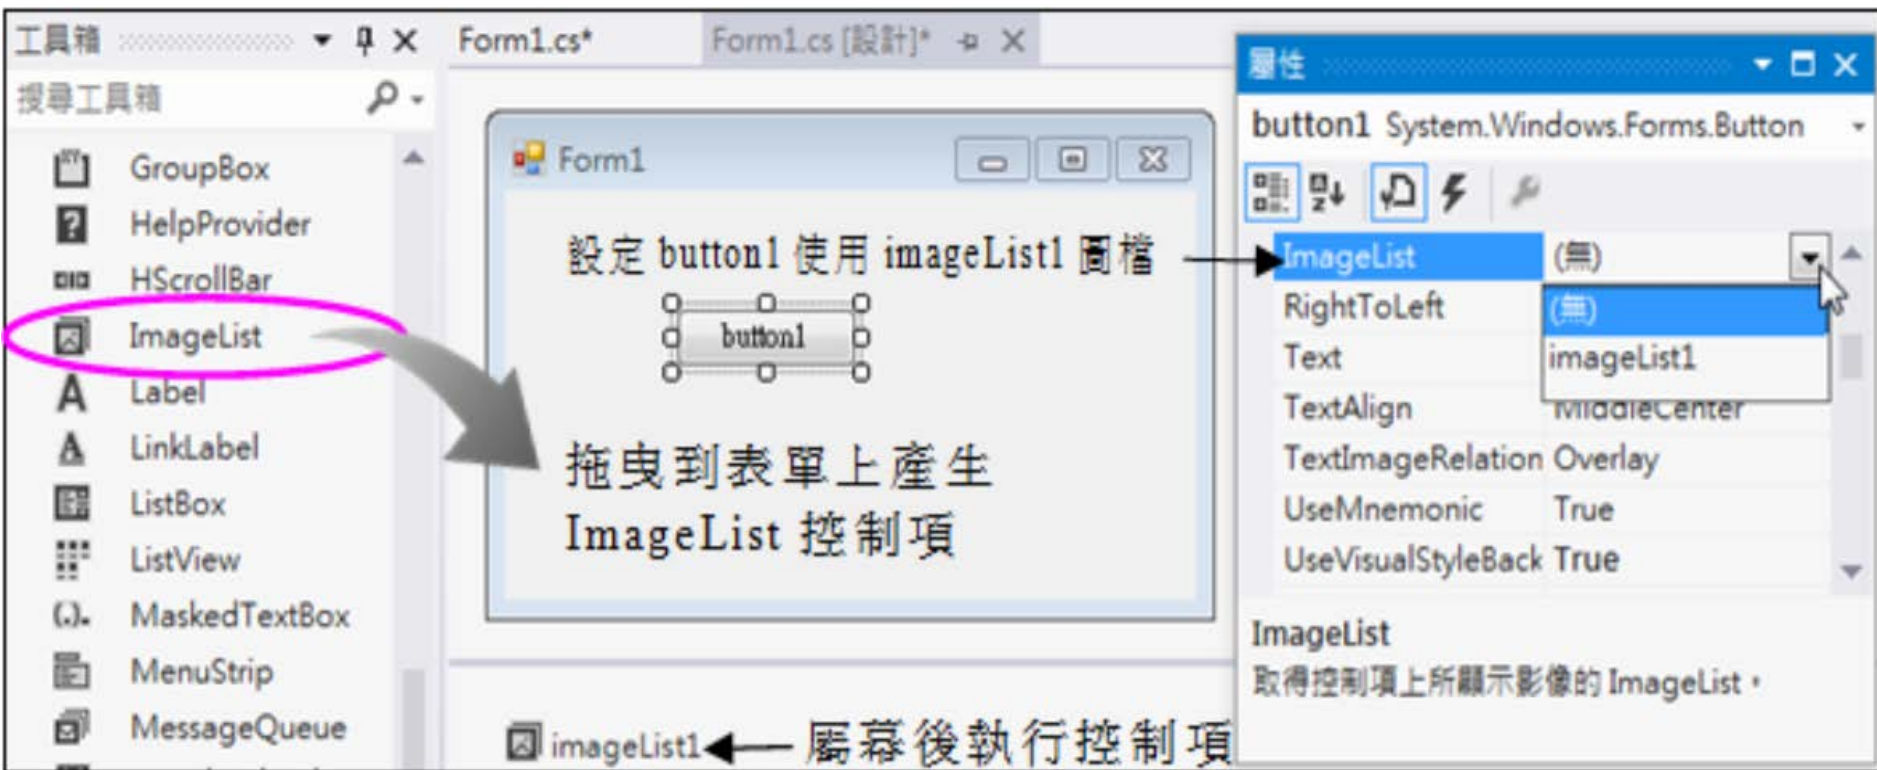

```
btnCar.ImageIndex=0 ;
```

**2. The control items which have Image property can use Images property of ImageList to get images, e.g.: PictureBox**

**Ex: show the 1<sup>st</sup> image of imgCars on picCar button**

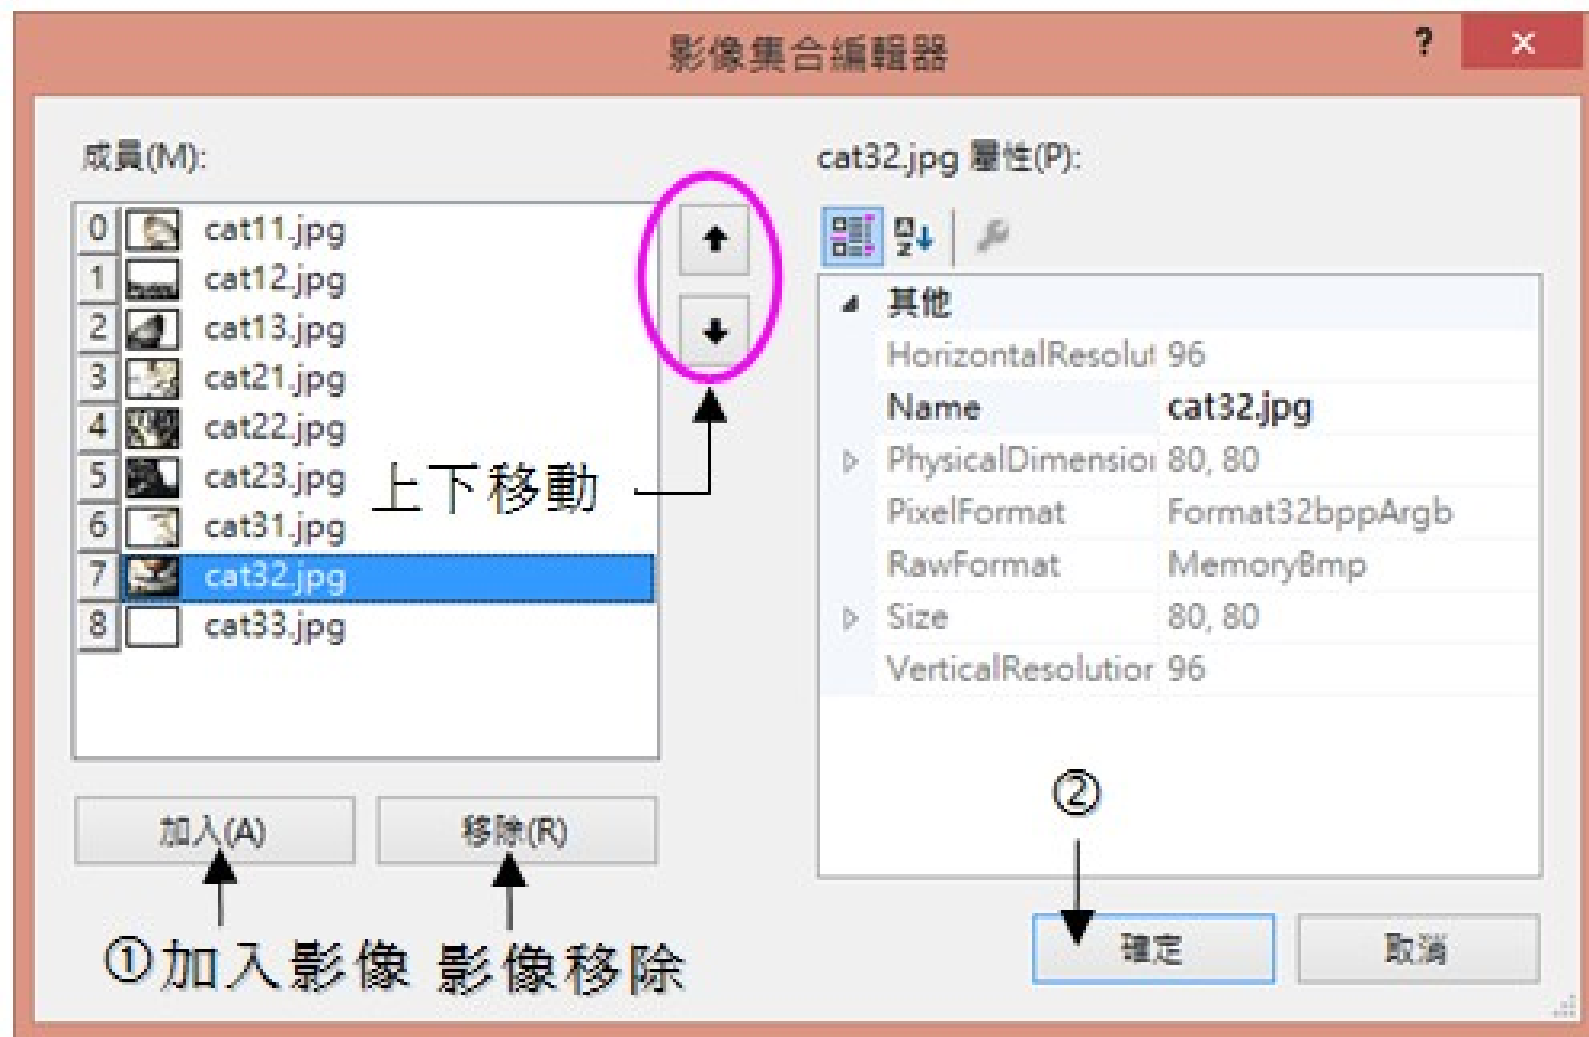

**`picCar.Image=imgCars.Images[0];`**

# ImageList Properties

Property	Description
Images	Save the collection of ImageList Ex: assign Image of picShow PictureBox to be the 1 <sup>st</sup> image of imgPic ImageList <code>picShow.Image = imgPic.images[0];</code>
ColorDepth	Set color bits of saved images, values: Depth4Bit, Depth8Bit(default), Depth16Bit, Depth24Bit, Depth32Bit
ImageSize	Set the width and height of saved images The maximum is 256, default is 16

# Add Image in ImageList

# ImageList Methods

## 1. Add() method

add a new image after the end of image collections

Grammar

```
controllItemName.Images.Add(new Bitmap(imageFile));
```

**Ex: add C:\cat1.bmp to imgCats ImageList, usage:**

```
imgCats.Images.Add(new Bitmap("c:\\cat1.bmp"));
```

## 2. Clear() method

remove all images from ImageList

Grammar

```
controlItemName.Images.Clear();
```

**Ex: remove all images from imgCats ImageList, usage:**

```
imgCats.Images.Clear();
```

### 3. RemoveAt() method

remove the image with the designated index

Grammar

```
controlItemName.Images.RemoveAt(index);
```

**Ex: remove the 1<sup>st</sup> image from imgCats ImageList, usage:**

```
imgCats.Images.RemoveAt(0);
```

## Example(puzzle):

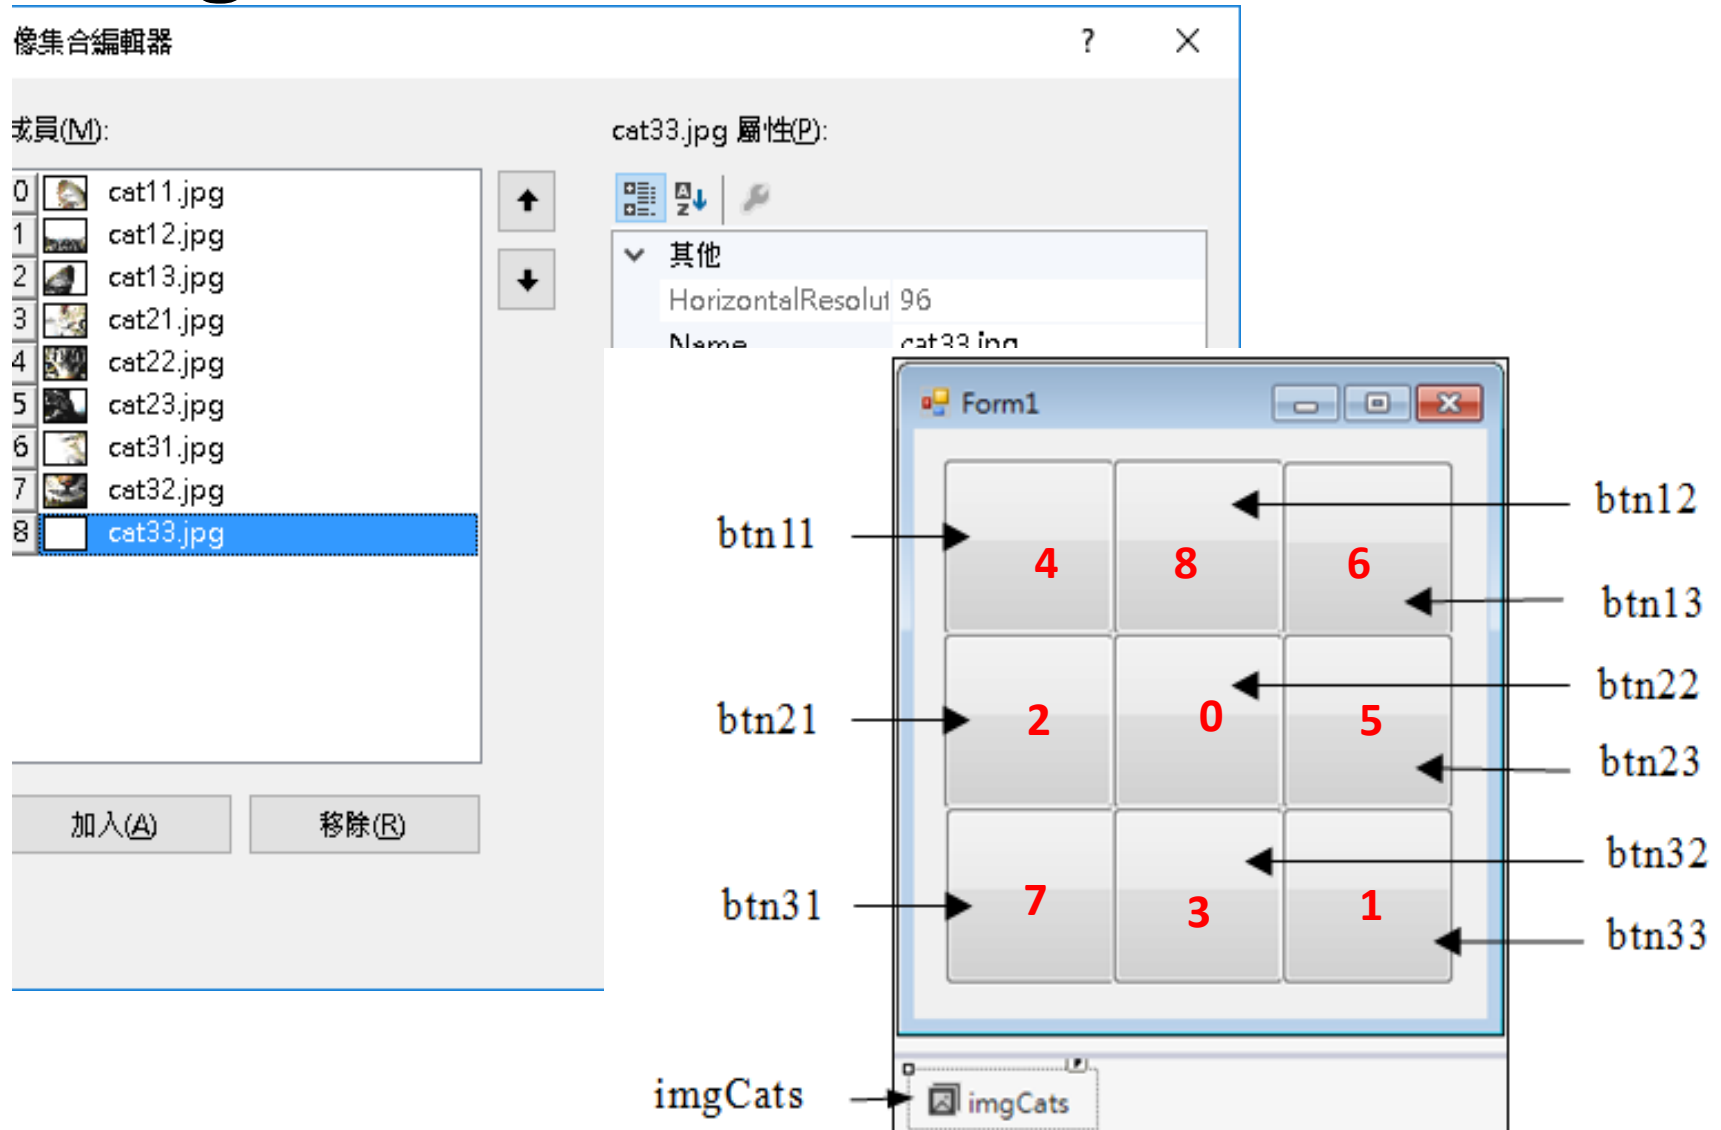

Design a movable puzzle game:

1. The picture of cat is divided into 9 parts. 8 parts are separated into 9 buttons when the program starts
2. Click on a button which has one part of cat's picture, the clicked button is exchanged with the blank button like the following figure.

Click and the picture is moved to the blank button

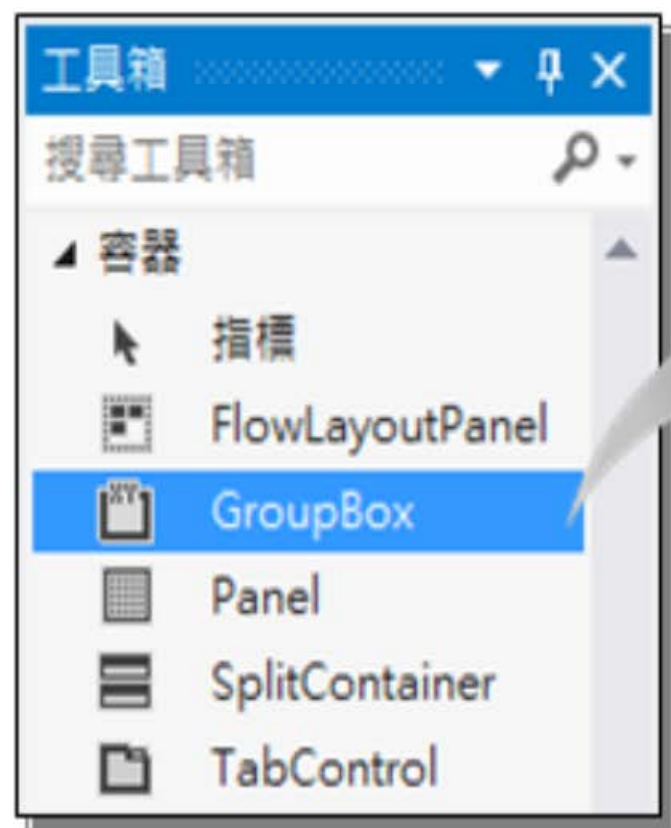

# Design User Interface

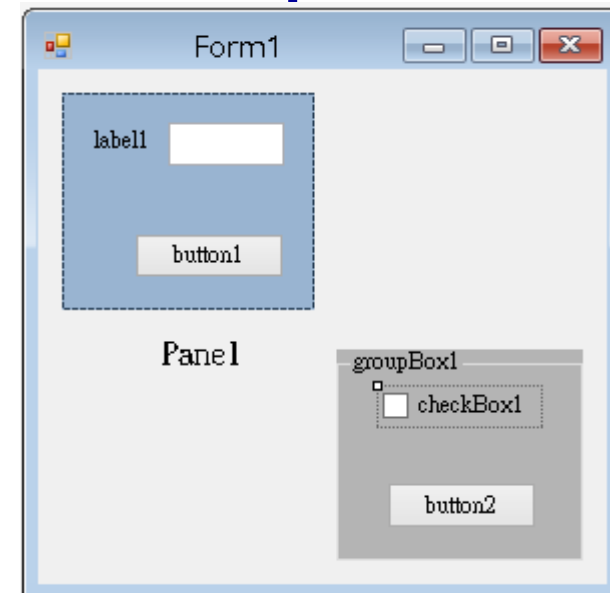

## 7-5 GroupBox & Panel Control Item

- The form contains control items – container
- Objects can be taken as a container in C#: Form, GroupBox, Panel, TabControl, etc.
- Characteristics of containers and included control items:
  - 1.container completely separates inner control items and outer control items
  - 2.the coordinator basis of inner control items is container
  - 3.inner control items move when the container is moved

# Creation of the Panel

- A container can include control items
- No title text at the left-top corner of Panel
- GroupBox can have title text
- Panel can have scroll bars and include more control items, thus saving more form space than GroupBox
- AutoScroll = True,  
Panel has scroll bars

## Example(GroupBox):

Design a breakfast ordering program, requirements:

1. Choose the set and input the amount, then the pay is shown automatically
2. Each set has a main meal, a side dish and a drink.
3. If the side dish is fries, 5 dollars for “薯條加大” upgrade is available  
If the side dish is not fries, “薯條加大” upgrade check box is disabled and unchecked
4. Every drink has a 5-dollar upgrade “飲料加大”
5. When the program starts, default:
  - ① Main meal is “1 號餐：雞塊餐(115 元)”
  - ② Side dish is “薯條”
  - ③ Drink is “汽水”
  - ④ “薯條加大” upgrade and “飲料加大” upgrade are unchecked
6. Unit price field changes the value according the chosen items. Quantity field default value is 1. The total money field always shows the result of unit \* quantity

## Result:

活力早餐店

主餐

☒ A餐：雞塊餐(75元)

☐ B餐：漢堡餐(60元)

☐ C餐：三明治餐(50元)

# Design User Interface

The image shows a screenshot of a user interface for a breakfast shop named '活力早餐店' (Vital Breakfast Shop). The interface is divided into four main sections: 主餐 (Main Course), 副餐 (Side Dish), 飲料 (Beverage), and 升級 (Upgrade). Each section contains a list of items with radio buttons for selection. At the bottom, there is a calculation area for the total amount.

**主餐 (Main Course):**

- ☒ A餐：雞塊餐(75元)
- ☐ B餐：漢堡餐(60元)
- ☐ C餐：三明治餐(50元)

**副餐 (Side Dish):**

- ☒ 薯條
- ☐ 薯餅
- ☐ 生菜沙拉

**飲料 (Beverage):**

- ☒ 雪碧
- ☐ 可樂
- ☐ 鮮奶茶
- ☐ 冰咖啡

**升級 (Upgrade):**

- ☐ 薯條加大
- ☐ 飲料加大

**Annotations:**

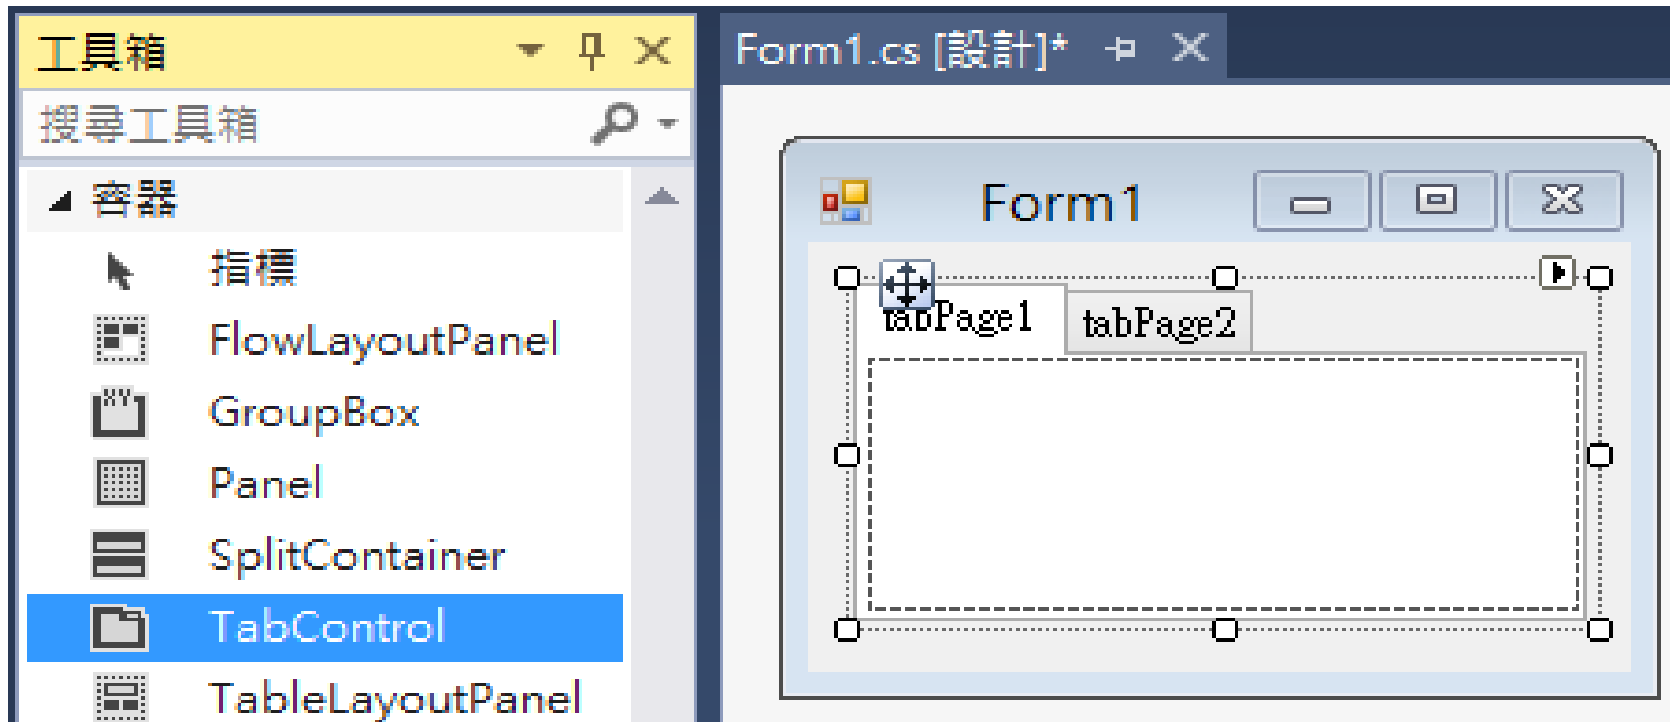

- rdbM1~rdbM3** points to the radio buttons for the main course items.
- rdbS1~rdbS3** points to the radio buttons for the side dish items.
- rdbD1~rdbD4** points to the radio buttons for the beverage items.
- Ch = kS,** points to the upgrade section.
- txtSum** points to the '小計' (Subtotal) label.
- txtNum** points to the '數量' (Quantity) label.
- txtAmt** points to the final result box in the calculation area.

**Calculation Area:**

小計  \* 數量  =  元

## 7-6 TabControl Control Item

- A container
- Can have many TabPage items
- Each tab can have other control items

## Properties of TabControl

Property	Description
TabPages	Container of tab pages, includes every TabControls
Appearance	<p>① Normal( <b>default</b> )    ② Buttons    ③ FlatButtons</p> 
Multiline	<p>False: show tab in single line (default) True: multi lines is accepted</p> 

## TabControl Methods

Method	Description
Add	Add a tab, usage: <code>TabPage myTabPage = new TabPage("Drinks");</code> <code>tabControl1.TabPages.Add(myTabPage);</code>
Remove	Remove target tab, usage: Ex1: <code>tabControl1.TabPages.Remove(myTabPage);</code> Ex2: <code>tabControl1.TabPages.Remove(tabControl1.SelectedTab);</code>
Clear	Remove all tabs, usage: <code>tabControl1.TabPages.clear();</code>

## TabControl Events

Method	Description
Click	Click event of TabPage object is triggered when click on tab's main content
SelectedIndexChanged	Triggered when the user clicks on tab title to change tab

**e.g.**

**To make tabPage2 the working panel, use the following  
grammar: `tabControl1.SelectedTab = tabPage2`**

## Example(TabControl):

Use tab pages to design a breakfast ordering program, the function is identical to the previous practice.

1. TabControl has 4 tab panels, the titles are “主餐”, “附餐”, “飲料” and “升級”
2. There are 3 check box items called “A餐：雞塊餐(75 元)”, “B餐：漢堡餐(60 元)”, “C餐：三明治餐(50 元)” in the “主餐” tab panel.
3. There are 3 check box items called “薯條” and “薯餅”, “生菜沙拉” in the “附餐” tab panel
4. There are 4 check box items called “雪碧”, “可樂”, “鮮奶茶” and “冰咖啡” in the “飲料” tab panel
5. There are 2 check box items called “薯條加大” and “飲料加大” in the “升級” tab panel

# Result:

## Math.Pow()

- Math.Pow()  
The calculation raises the number to the exponent of other numbers.
- double power: exponent

- example:

Input : base = 8, power = 2

Output : 64

Input : base = 2.5, power = 3

Output : 15.625

```
// 6 is base and 2 is power or  
// index or exponent of a number  
double pow_ab = Math.Pow(6, 2);  
// Print the result  
Console.WriteLine(pow_ab);  
// 3.5 is base and 3 is power or  
// index or exponent of a number  
double pow_tt = Math.Pow(3.5, 3);  
// Print the result  
Console.WriteLine(pow_tt);
```

Output :

36

42.875

**The End**

**Take a Break**
